

# SCE Wildfire and PSPS Risk Models

Prepared for: Office of Energy Infrastructure Safety  
Wildfire Risk Modeling Workshop Oct. 5-6, 2021

# Executive Summary

- SCE has continuously improved its risk models since 2018, adding more granular asset-level data, advanced fire propagation algorithms, and several other enhancements
- SCE's Wildfire Risk Reduction Model (WRRM) Framework is SCE's primary means to estimate wildfire risk
- The WRRM has two primary components: 1) POI and 2) Consequence
  - The probability of ignition (POI) component is comprised of a series of machine learning models designed to estimate the probability of an ignition occurring from individual assets
  - The consequence component is designed to estimate the consequence if an ignition were to occur from that particular asset
- Additionally, SCE has developed a PSPS risk model which is used to calculate risk spend efficiency (RSE) and to inform PSPS decisions by comparing the risk of wildfire to the risk of PSPS during a PSPS event

# Agenda

Safety Moment

Evolution of Wildfire Risk Models

# Safety

## Are you Earthquake Prepared?

### Download the MyShake App

- The app is available on the Apple App Store and Google Play

### Turn on location services

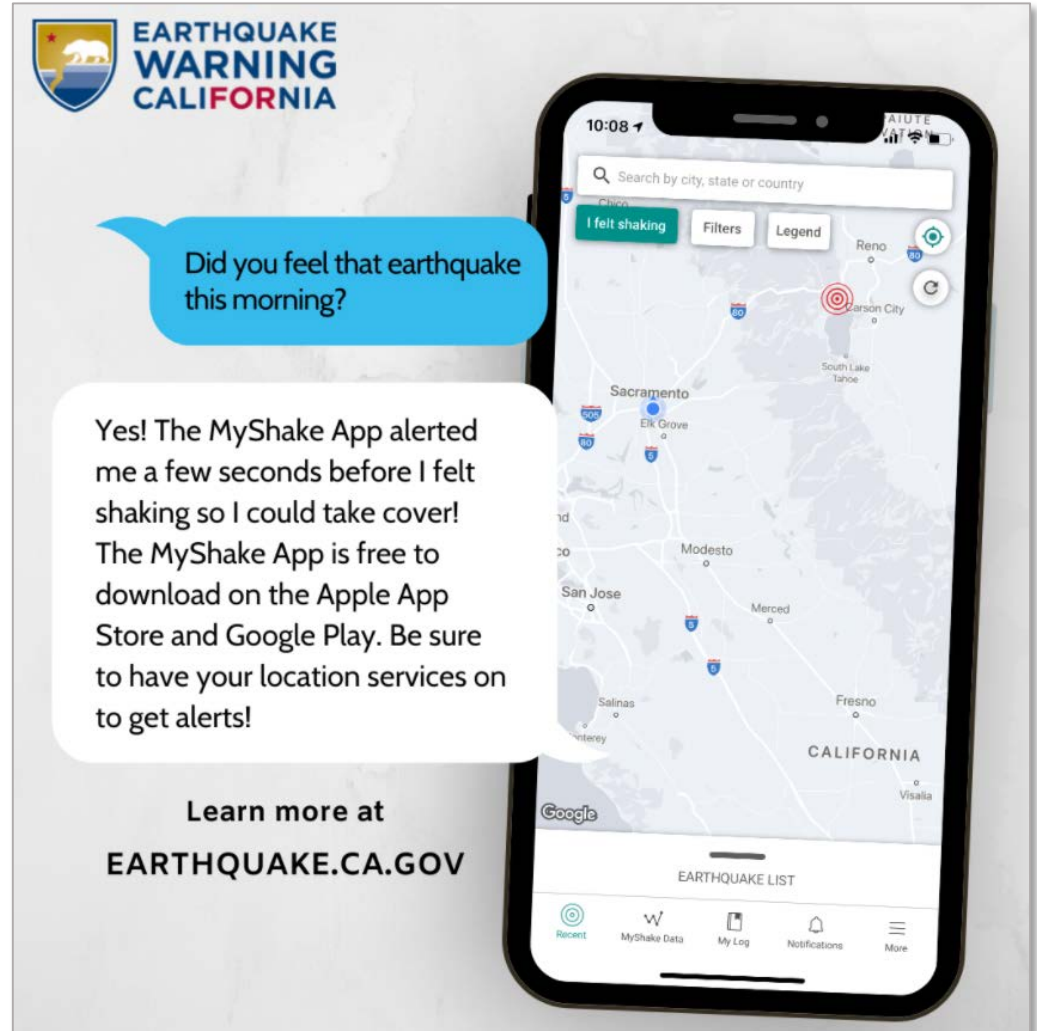

- The app used seismic sensors throughout California to alert users based on their location

### Receive earthquake alerts

- The app will automatically send users alerts for 4.5 magnitude or greater earthquakes

In the event of an earthquake:

**Drop, Cover, and Hold**

**EARTHQUAKE WARNING CALIFORNIA**

Did you feel that earthquake this morning?

Yes! The MyShake App alerted me a few seconds before I felt shaking so I could take cover! The MyShake App is free to download on the Apple App Store and Google Play. Be sure to have your location services on to get alerts!

Learn more at [EARTHQUAKE.CA.GOV](http://EARTHQUAKE.CA.GOV)

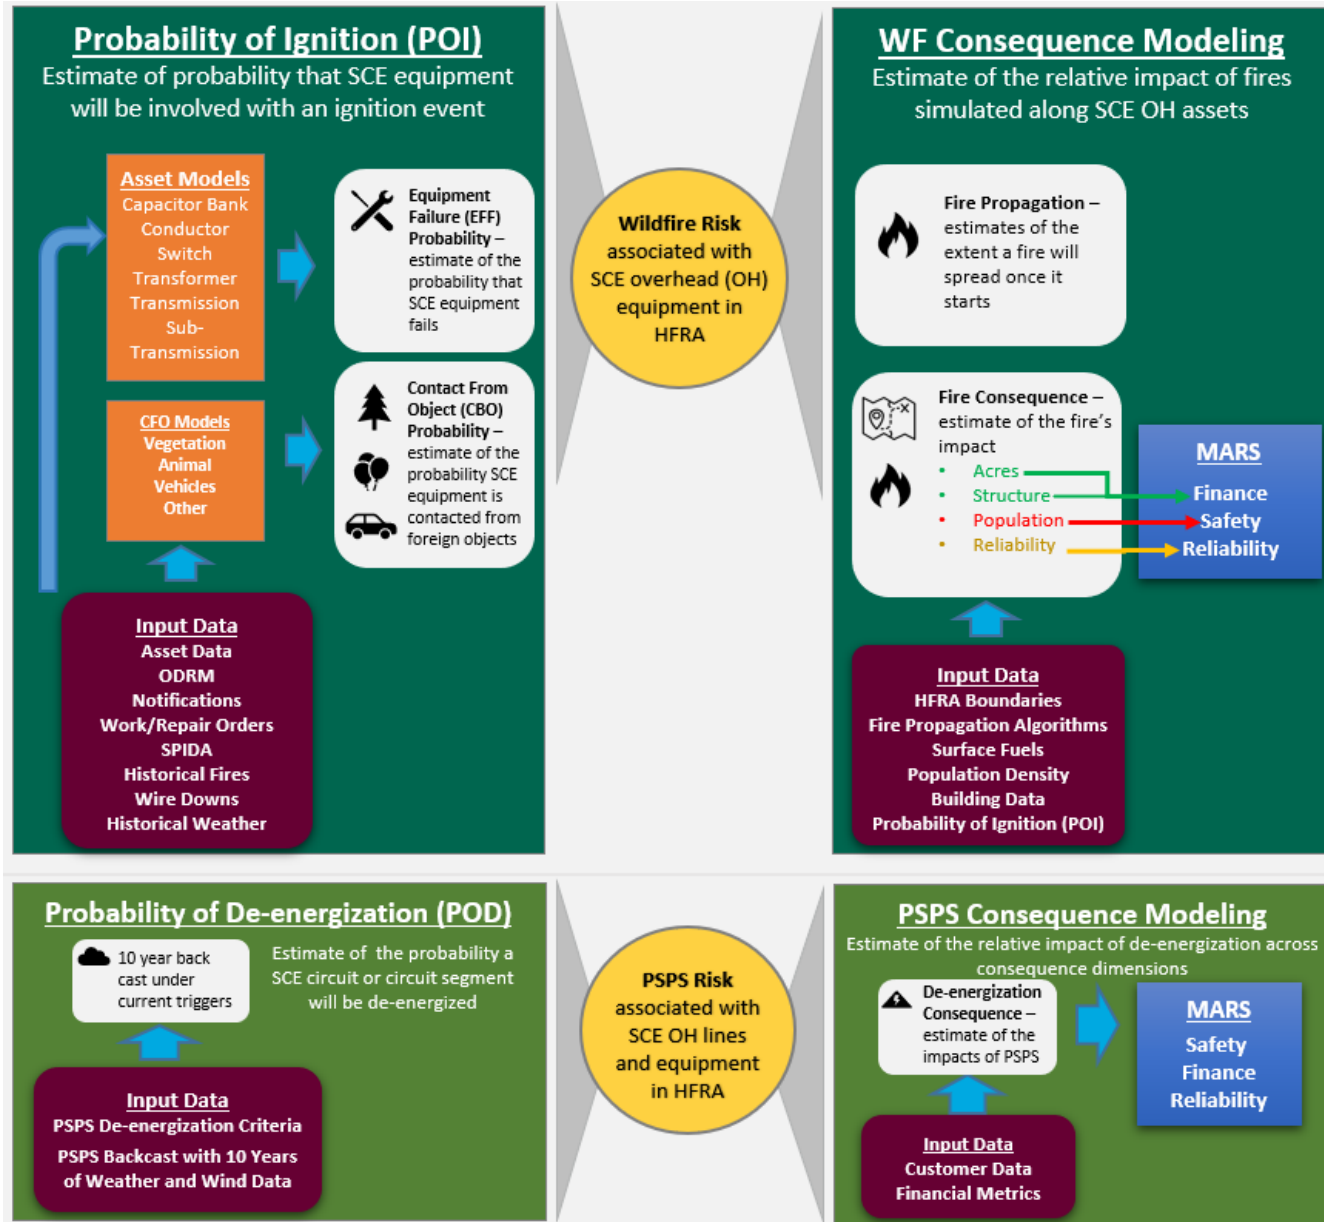

The image shows a smartphone displaying the MyShake app interface. The screen features a map of California with a red target icon indicating an earthquake location near Carson City. A blue speech bubble asks, 'Did you feel that earthquake this morning?' and a white speech bubble responds, 'Yes! The MyShake App alerted me a few seconds before I felt shaking so I could take cover! The MyShake App is free to download on the Apple App Store and Google Play. Be sure to have your location services on to get alerts!'. The app interface includes a search bar, a 'I felt shaking' button, and a bottom navigation bar with icons for 'Recent', 'MyShake Data', 'My Log', 'Notifications', and 'More'. The top of the screen shows the time as 10:08 and the AT&T logo.

# SCE Wildfire Risk Reduction Model (WRRM) Framework

*The WRRM leverages the risk bowtie to organize various components and is the foundation for risk information prioritization of mitigation activities.*

# Multi Attribute Value Framework (MAVF)

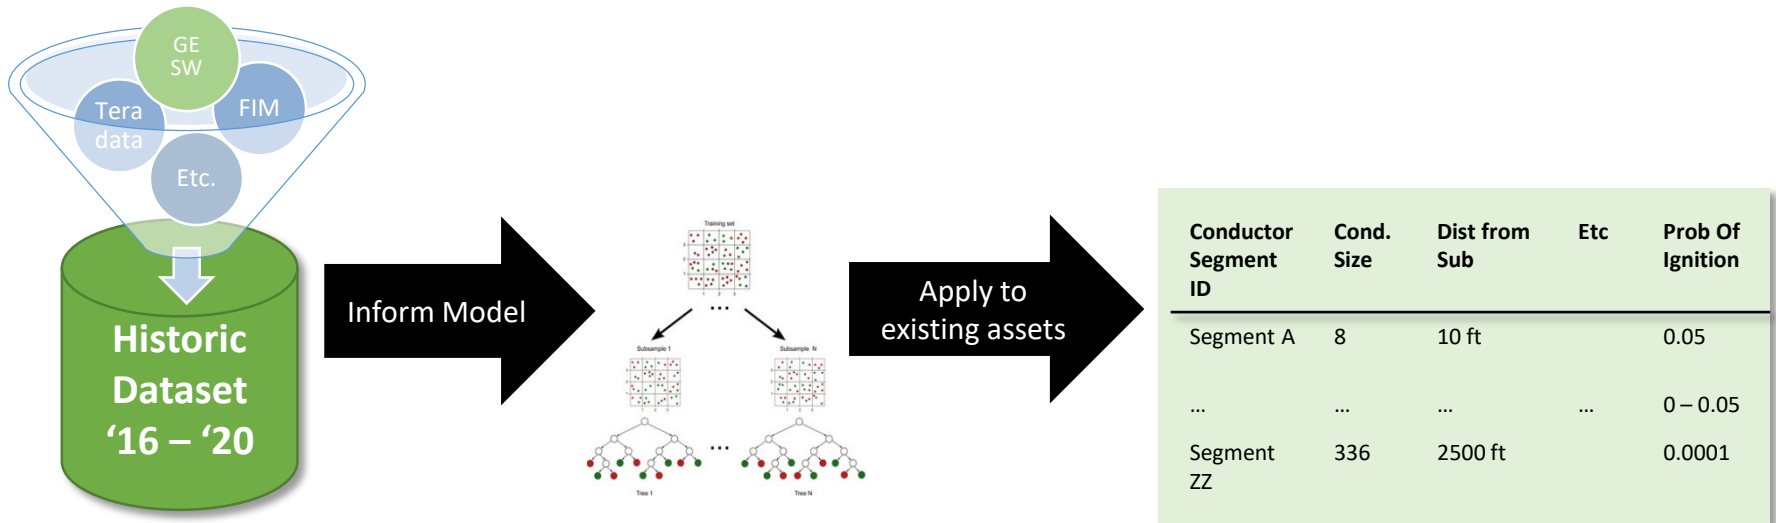

- A **Multi-Attribute Value Framework (MAVF)** is used to convert natural unit consequences into a “unit-less” risk score. SCE’s MAVF is referred to as a **Multi-Attribute Risk Score (MARS)**.
- MARS values are used to (1) compare relative risk across risk types, and (2) to compare relative risk reduction as a result of mitigation activities.

		<b>Weights</b> Relative importance of each attribute relative to each other	<b>Range</b> of potential impacts (annually)	<b>Scaling Function</b> converts the natural units of each attribute to a generic unit-less range from 0-100
<b>Attribute</b>	<b>Unit</b>	<b>Weight</b>	<b>Range</b>	<b>Scaling</b>
Safety	Index*	50%	0 – 100	Linear
Reliability	CMI	25%	0 – 2 Billion	Linear
Financial	\$	25%	0 – 5 Billion	Linear

Safety Index = 1.0 \* (# of fatalities) + ¼\*(# of serious injuries)

# POI Modeling: The Processes

The POI model uses past successes & failures to understand relevant conditions (asset characteristics). It learns from these observations so it can predict the future successes & failures. This means there must be consistency in the data used for characterizing assets for the historic dataset & for the dataset we want to predict outcomes for (existing infrastructure/assets).

## “The Data”

Multiple data sources are collected & packaged as data inputs, based on SME input

## “The Model”

A machine learning model is created in order to predict failures

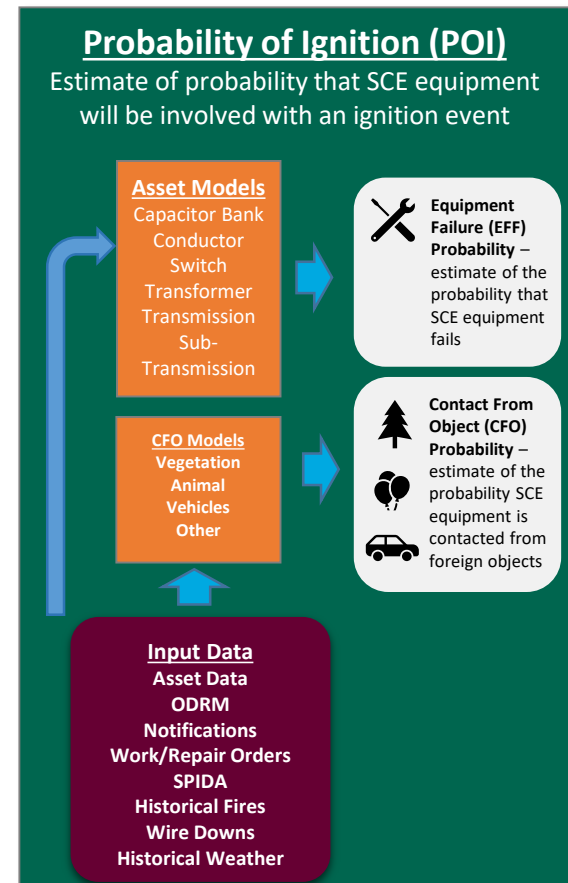

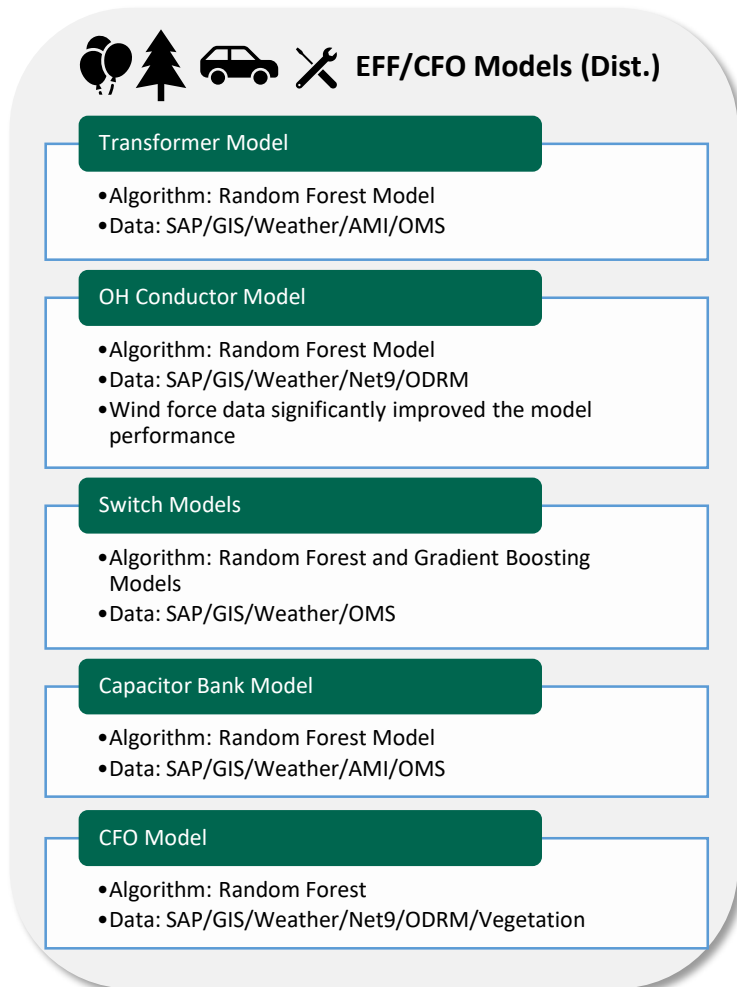

## “The Model Output”

The model output is a ranking of individual assets, with assigned probabilities of failure

# WRRM: POI Models, Data Input and Output

Ignition drivers - Equipment/Facility Failure (EFF) and/or Contact From Object (CFO) – are assessed through component-specific models with machine learning algorithms. The result is an estimate of the Probability of Ignition (POI) at individual locations. SCE refers to this as Functional Location (FLOC)-level POI with FLOC which is typically a structure location with equipment.

# POI Modeling: Data Sources Used (CFO Example)

POI model leverages big data and machine learning algorithms to improve model accuracy

## Cable/Conductor Databases

- ~1.2M segments
- ~700K primary conductor
- ~500K cable

## NCAR / WRF Weather Data

- ~22.3B raw data points
- ~500K wind values

## Geospatial Databases

- Length, Material etc.

## Outage Data

- ~500 outage cause codes
- ~150K historical outages

## Asset Data

- ~2M FLOCs with active D/T Poles and SL
- Pole Features
- Lat/Long

## Avian/Animal Incidents

## Vegetation-Distance from Lines

## Traffic incidents

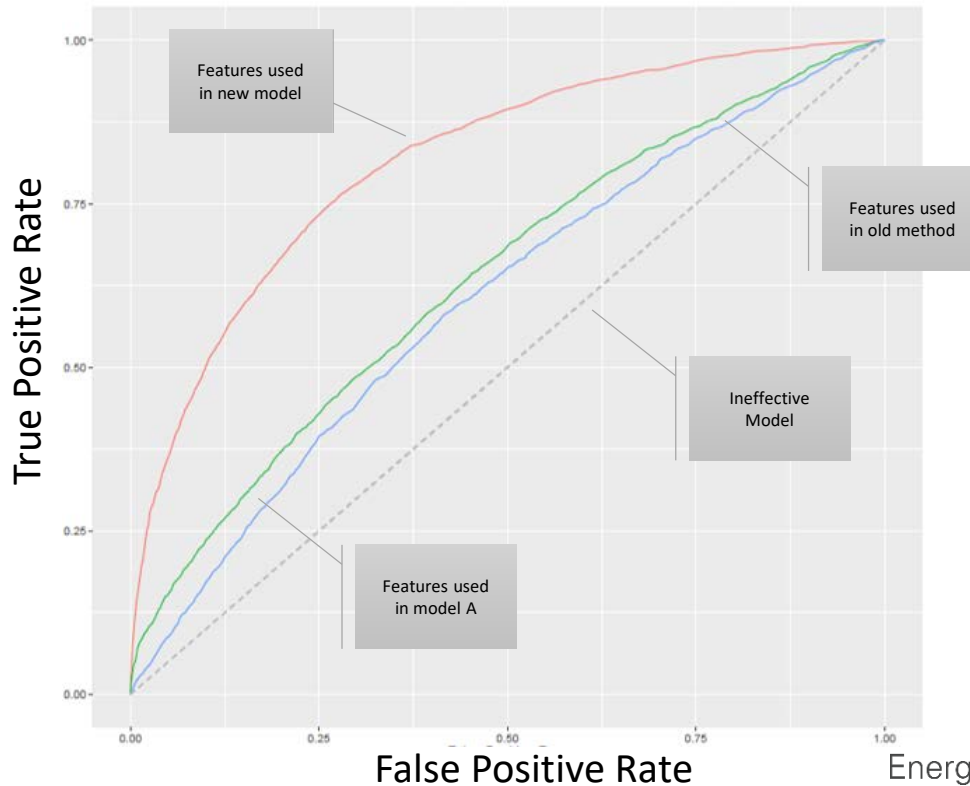

## Operation Data

- Switch counts

# POI Modeling: Validation And Accuracy

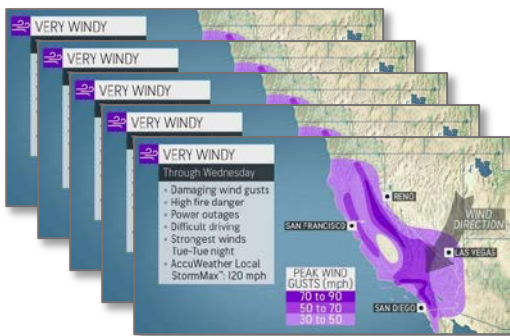

POI model validation is performed throughout each model creation/update cycle. Model performances are measured by AUC (Area Under of Curve) of the ROC plot.

# WRRM: Wildfire Consequence

The consequence module simulates the potential progression of an ignition, including the acres, buildings, and population which could be impacted by a fire event. These ignitions are simulated in proximity to every asset over an 8 hour burn period, across several weather and wind scenarios. These scenarios reflect known climate change conditions to date.

Catalog of Fire Weather and Wind Conditions

Buildings

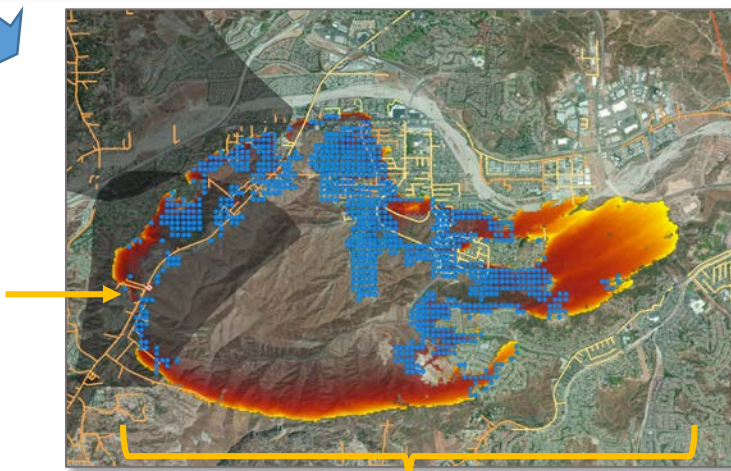

Population

Surface fuels

(1) Simulated ignition point

(2) Simulated fire shed

(3) Acres, buildings, and population within the simulated fire shed

## WF Consequence Modeling

Estimate of the relative impact of fires simulated along SCE OH assets

**Fire Propagation** – estimates of the extent a fire will spread once it starts

**Fire Consequence** – estimate of the fire's impact

- Acres
- Buildings
- Population

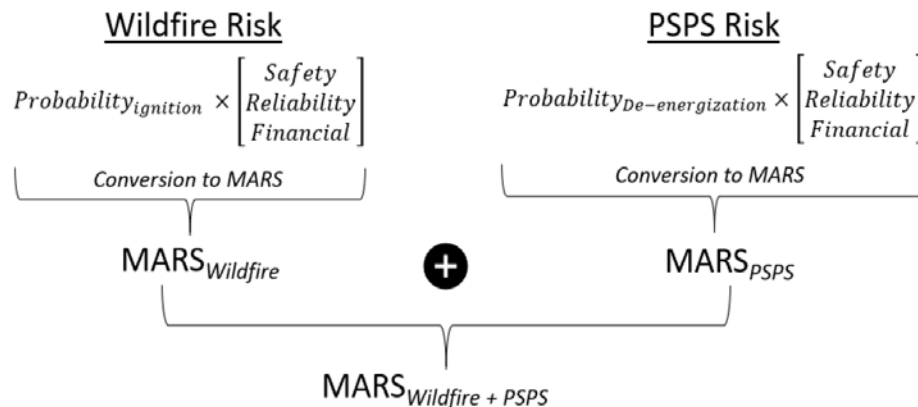

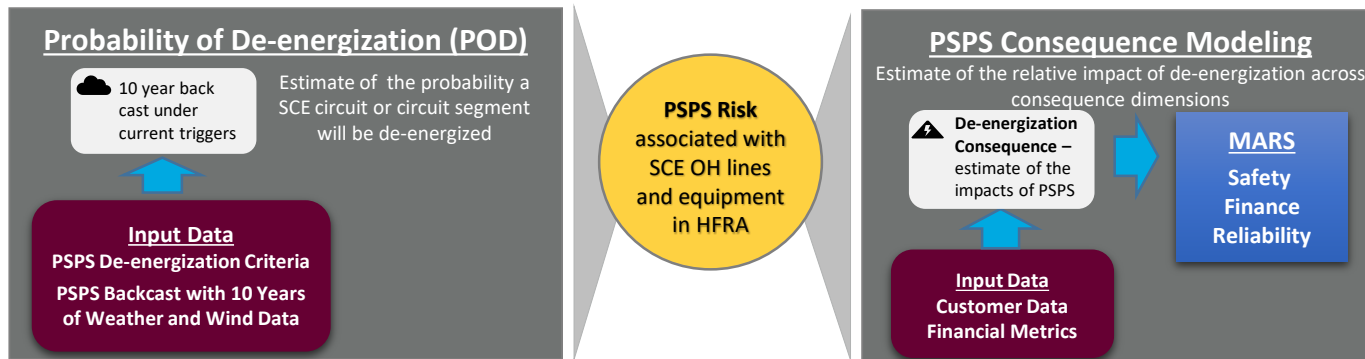

**Input Data**

- HFRA Boundaries
- Fire Propagation Algorithms
- Surface Fuels
- Population Density
- Building Data

# WRRM: PSPS Risk Modeling

PSPS risk model is based on a back cast of wind and weather conditions which could lead to a PSPS de-energization decision based on 2020 criteria (wind speeds, FPI, etc.).

At present, SCE utilizes a PSPS Model to inform RSE calculations to understand initiatives that reduce the impact of PSPS on customers. SCE will consider incorporating the PSPS risk model in mitigation scoping in 2023 for remaining segments.

# IOU Collaboration

- Since the 2019 WMP process, SCE, PG&E and SDG&E have conducted wildfire-related benchmarking sessions on various topics, including risk modeling, mitigation effectiveness, vegetation management activities, and PSPS operations
- PG&E, SCE and SDG&E collaborated on at least 10 occasions in 2021 on risk assessment and modeling alignment opportunities
- IOUs have evaluated elements of risk modeling where near-term alignment could be achieved
- Currently developing a common vision (end-state) for long-term alignment on risk modeling, while recognizing differences

# Internal / Third-Party Validations

- SCE's Enterprise Risk Management (ERM) organization provides input to and oversight of the wildfire risk model.
  - ERM provides independent input and review during model development
  - For major updates, prior to implementation, ERM runs a challenge session or "red-team" review to pressure test changes.
  - Updates to the consequence models performed and tested by a cross-functional team of experts, including fire science, data scientists, and risk management (e.g., REAX to Technosylva, updates to Technosylva, and new use cases)
  - Additional third-party validation also performed to validate changes to statistical and machine learning models
  - Governance of model changes includes review and discussion with senior management prior to implementation

# Planned Future Improvements

- Updates for 2021 WMP Progress Report
  - Joint Utility Risk Working Groups (RSEs and Risk Modeling)
  - Updated Risk Analysis
  - Mitigation Optimization
- Updates for 2022 WMP Update
  - Technosylva Fire Propagation refinements
    - Updated fuel layer
    - 400+ additional wind & weather scenarios
- Related Proceedings/Filings
  - PSPS OII
  - Risk OIR
  - 2022 RAMP Filing
